                                                                                                                                             2 Polynucleotides (AAT72684 and AAT72685) represent 2 distinct clust of genes encoding enzymes (AAW19734-36 and AAW19737-42) involved in biosynthesis and attachment in Saccharopolyspora erythraea. The eryB genes are involved in the biosynthesis of I-mycarose and the eryC ge involved in the biosynthesis of D-desosamine. Novel glycosylation—modified polyketides are produced by selectively altering, inactivat or augmenting these eryB and/or eryC genes and introducing them into
                                                                                                                                                                                                                                                        generate poly:
glycosylation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     맑
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
CC comprising a desonance biosynthetic gene cluster, a fragment or its CC biologically active variant, where the nucleic acid sequence is not CC derived from the eryC gene cluster of Saccharopolyspora erythraea or CC Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster, or fragments thereof. The macrolide CC biosynthetic gene cluster encodes proteins which synthesise methymycin, parbomycin or a combination of these CC empounds. Recombinant or augmented cells comprising the desosamine CC and/or macrolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic proteins CC are useful for synthesis of methymycin, pikromycin, neomethymycin and CC marbomycin. The alternative termination of polyketide synthesis may be cuseful to prepare novel antibiotics and polyhydroxyalkanoate (PHA) CC monomers. The compounds produced by the recombinant host cells are useful cost as biopolymers, e.g., in packaging or biomedical applications, to

Streptomyces venezuelae desosamine gene cluster.

RESULT 6
AAD39043
ID AAD39043 standard; DNA; 13613 BP.
XX
AC AAD39043;
XX
DT 23-SEP-2002 (first entry)
XX
DT 8
Streptomyces venezuelae desosamine;
XX
KW Glycosylated polyketide; modified remaine; angucycline; angucycline; anthracycline; angucycline; anthracycline; polyether; an KW desosamine; des; gene; ds.
XX
OS Streptomyces venezuelae. Glycosylated polyketide; modified recombinant bacterial host cell; mRBHC; macrolide; anthracycline; angucycline; avermectin; milbemycin; tetracycline; polyene; polyether; ansamycin; isochromanequinone; sugar; desosamine; des; gene; ds.

                    sugar
                      structures.
```

The invention provides a method to alter the sugar structure diversity for a particular metabolite via the recruitment and collaborative action of sugar genes from a variety of sugar biosynthetic pathways to yield a metabolite comprising a non-natural sugar, e.g., a novel glycosylated polyketide. The invention also relates to a modified recombinant bacterial host cell (mRBHC) in which the expression and activity of nucleic acids encoding sugar biosynthetic enzymes has been altered. The mRBHCs may be cultured to produce the modified sugar products, e.g. a macrolide, anthracycline, angucycline, avermectin, milbemycin, tetracycline, polyether, ansamycin or isochromanequinone. The present sequence is Streptomyces venezuelae sugar (desosamine) biosynthetic gene cluster

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention comprises coding sequences for the narbonolide polyketide synthase gene from Streptomyces narbonensis. The DNA sequence of the invention are useful for providing polyydroxyalkanoate monomer for medical and industrial applications. The present DNA sequence encodes a Streptomyces venezuelae desosamine gene cluster protein which was used the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid comprising a narbonolide polyketide syntha-
gene from Streptomyces narbonensis, useful for providing a
polyhydroxyalkanoate monomer for medical and industrial applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Streptomyces venezuelae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (SHER/)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated and purified nucleic acid segment cc comprising a desosamine biosynthetic gene cluster, a fragment or its comprising a desosamine biosynthetic gene cluster of Saccharopolyspora exythraca or compounds the eryC gene cluster of Saccharopolyspora exythraca or cc biosynthetic gene cluster crocodes proteins which synthesise methymycin, parknesses are useful for the proteins of biosynthetic gene cluster encodes proteins which synthesise methymycin, compounds. Recombinant or augmented cells comprising the desosamine cc and/or macrolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic proteins cc useful to prepare novel antibiotics and polyhetide synthesis are useful for synthesis of methymycin, pikromycin, neomethymycin and cc as biopolymers, e.g., in packaging or biomedical applications, to cc engineer PHA monomer synthases or to prepare biologically active agents, cc hromic obstructive pulmonary disease as well as other diseases involving respiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., fungicides or insecticides) via expression of polyketides in plants. The present sequence represents the desosamine cc biosynthetic gene cluster (pik) from Streptomyces venezuelae ATCC 15439, cc as given in figure 32. (Updated on 15-5EP-2003 to standardise OS field)

The invention relates to genes and proteins involved in the biosynthesis of macrolides by microorganisms. In particular it relates to the nucleic acids forming the biosynthetic locus for rosaramicin (a 16-member macrolide antibiotic) from Micromonospora carbonacea. The invention is useful for the biosynthesis of macrolides by microorganisms. It allows direct manipulation of macrolides and related chemical structures by chemical engineering of the proteins involved in the biosynthesis of rosaramicin. It is useful to catalyse certain biochemical reactions, in vitro or in vivo, to direct or enhance the synthesis or modification of a vitro or in vivo, to direct or enhance the synthesis or modification of a vitro or in vivo, to direct or enhance the synthesis or modification of a vitro or in vivo, to direct or enhance the synthesis or modification of a vitro or in vivo, to direct or enhance the synthesis or modification of a vitro or in vivo, to direct or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the synthesis or modification of a vitro or enhance the vitro or enhance the vitro or enhance the vitro or enhance the vitro or enhance o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CDS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel polynucleotide, specifically a biosynthesis gene, comprising a nucleotide sequence which encodes a protein, where the gene is concerned with the biosynthesis of midecamycin. The polynucleotide of the invention demonstrates antimicrobial activity and may be useful for the biosynthesis of midecamycin, as well as for manufacturing macrolide compounds other midecamycin. The current sequence is that of the Streptomyces mycarofaciens midecamycin polyketide synthetase (PKS) DNA of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              macrolide; midecamycin biosynthesis;

The present sequence is used to produce the recombinant DNA compounds of the invention. The specification describes a recombinant DNA compound expressing recombinant polyketide synthase genes in host cells for the production of narbonolide, narbonolide derivatives and polyketides that are useful as antibiotics and as intermediates in the synthesis of compounds with pharmaceutical value. The DNA compounds may also encode a C12-hydroxyalse (picK), desosamine biosynthesis and desosaminyl transferase enzymes (useful for conversion of ketolides to antibiotics), and the beta-glucosidase enzyme (involved in picromycin biosynthesis) of the compounds are also useful for increasing the antibiotic activity of a compound relative to the unhydroxylated compound. The recombinant host ity of

This is contig 005 from the recombinant cosmid pKOS023-27 DNA sequence CC (see AAZ56001) which contains a Streptomyces venezuelae DNA insert. The cosmid contains open reading frames which encode the various modules of the narbonolide polyketide synthase (PKS). The invention relates to recombinant DNA containing a coding sequence for a narbonolide PKS. CC (Polyketides are compounds synthesised from 2-carbon units through a coding sequence modifications. Modular PKSs are CC responsible for the production of many antibiotics including picromycin. The narbonolide PKS consists of a loading module, six extender modules, and two thioester domains. Four proteins make up the narbonolide PKS (CPICAI, PICAII and PICAIV). PICAI includes extender modules and 2, PICAII includes extender module 6 (PICAI, PICAII includes extender module 5 and 4, occombinant form the PICB protein. The nucleotide sequences encoding all of these proteins can be isolated in recombinant form from the recombinant CC instead proteins can be isolated in recombinant form from the recombinant CC commid pKOS023-27. Narbonolide is desosaminylated in S. venezuelae to CC vield narbomycin, the desosamine biosynthetic genes are also found in CC expression, and the desosamine biosynthetic genes are also found in CC express, in transformed cells, narbonolide (or its derivatives) or other enzymes recombinantly expressed in the same hosts) to polyketide con this form the recombinant promoter of the protein intermediates. The antibiotics are useful in human cc or veterinary medicine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                             Streptomyces venezuelae (SV) narbonolide polyketide Synthases (PKSS). The recombinant PKSs are derived from narbonolide PKS and other genes involved in narbomycin and picromycin biosynthesis in recombinant host cells. The invention also discloses the S. venezuelae PKS gene cluster that results in the production of picromycin. Also disclosed are enzymes such as those responsible for glycosylation and hydroxylation, (e.g. Cl2 hydroxylase (PicKI), desosamine biosynthesis, and desosaminyl transferase enzymes. The recombinant narbonolide, narbonolide derivatives, and polyketides are useful as antibiotics and as intermediates in the synthesis of compounds for pharmaceutical applications. The present sequence encodes S. venezuelae PICCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  06-NOV-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         producing desosamine transferase polyketides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    US6509455-B1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Streptomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The

The present invention relates to novel recombinant DNA compound that encodes a domain of a narbonolide polyketide synthase (PKS), a desogamin biosynthetic gene, a desogaminyl transferase gene or a beta-glucosidase gene of Streptomyces venezuelae, or a pick hydrolase gene of S. venezuelae. The recombinant DNA compounds are useful in expressing
                                                                                                                           New recombinant DNA compounds encoding a narbonolide polyketide synthase, useful for expressing recombinant polyketide synthase genes in host cells for the production of narbonolide and polyketides useful as antibiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Narbonolide polyketide synthase; PKS; deso desosaminyl transferase; beta-glucosidase; pharmaceutical; gene therapy; antibacteria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Streptomyces

recombinant polyketide synthase genes in host cells for the product narbonolide or its derivatives and polyketides that are useful as antibiotics and as intermediates in the synthesis of compounds with pharmaceutical value. They may be used for treating e.g. bacterial infections. The invention is also useful in gene therapy. The press sequence is Streptomyces venezuelae pKOSO23-26 cosmid DNA 005 continuation.
                                                                                                                                                                                      for the production

of polyketides by recombinant DNA technology, useful as and as intermediates in the synthesis of pharmaceutical

The present invention relates to recombinant DNA sequences encoding for narbonolide polyketide synthase (PKS) domain, and methods of producing polyketides by recombinant DNA technology. The recombinant DNA sequences are derived from Streptomyces venezuelae desosamine biosynthetic, desosaminyl transferase, beta-glucosidase, or pick (C12) hydroxylase genes. The method is useful for transforming a cell with a recombinant expression vector that encodes a functional beta-glucosidase gene, and therefore for increasing the yield of a desosaminylated polyketide in a cell. The recombinant methods and materials are useful for expressing polyketides with significant antibiotic activity, derived in whole or in part from the narbonolide PKS gene, and other genes involved in part greent sequence represents contain bosynthesis in recombinant host cells. The present sequence represents contain of S. venezuelae number of the presents contain the presents co containing

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
